

# Kobe Aero Network ~Towards building an Integrated Production System~

- The downstream companies of aircraft industry in Japan that are growing rapidly are building supply chains including small and medium companies aiming at cost down in order to become more competitive internationally.
- In addition such companies are taking account into consideration for avoiding risk of fluctuation of exchange to domestic manufacturing of aircraft parts from import.
- In order to cope with such demands, 21 companies in Hyogo Prefecture gather and establish “Kobe Aircraft Cluster” and the Cluster bundles each strong points and builds an integrated production system consisting of material procurement, machining, inspection and delivery of finished goods within the Cluster system

## Build a smooth flow in the integrated production system

Unifying contact points of dealings, we can allow smooth and integrated production with connected companies. By elimination of wasteful flows we can contribute largely to cost reduction and quality improvement.

### Equipment processing map

Kobe Aircraft Cluster aims at realization of integrated production system for aircraft parts manufacturing by mutual cooperation of the machining group (17 companies) and the special process group (4 companies).
